

### **TechTip #9 - EN\_LNCH.EXE error (PC based installations)**

If you encounter an EN\_LNCH.EXE error after updating other applications on your testing PC (FastTrack is one known offending application), you will need to repair files within your SkillCheck installation which were altered, corrupted or deleted.

To correct this, do the following;

1. Ensure you are logged onto the PC with full rights - that is, as PC Administrator
2. Using My Computer or Windows Explorer, browse to the folder location **C:\PROGRAM FILES\SKILLCHECK**
3. In this folder, there will be a file named **SYSUPDATE**. Double click on this file to run it. The setup routine may take several minutes.

This will update the files on your PC and add those that are missing, damaged or corrupted.

It might also be wise to do a System Database repair and back-up as well as a Scores Database repair and back-up. These utilities are found via the TestCentre menu as follows;

**FILE | ADVANCED | ADVANCED ADMISTRATOR | SCORES DATABASE**

Then perform the System Database Repair and Back-up (left panel) as well as the Scores Database Repair and Back-up (right panel). In both cases, save the back-up to the default location.
